CONCLUSON 11

INTRODUCTION

I was a Student Digital Ambassador for this literacy project. The main idea of the project is to figure out how we use tools in our daily lives and how to use them in a responsible way.

I did a lot of things for this project. I made an infographic to tell people about literacy. I also set up my digital portfolio on websites like GitHub, LinkedIn and Kaggle.. I practiced coding on HackerRank and CodeChef. I even learned how to write emails that sound professional and how to behave online.

Each thing I did for the project helped me use what I learned in a way. It was not about reading and learning but actually doing things. This project showed me how the way I am online the way I talk to people and the way I use technology every day can affect my school work and my future job.

This digital literacy project really helped me learn digital skills. I understand now why these skills are so important in a real way. The digital literacy project was an experience, for me.

Task 1: Infographic

I made a digital literacy awareness infographic using Canva for this task. I picked a layout with soft blue colors to make it look nice and easy to read. The soft blue colors make the easy to understand. I used Canva elements to make it look like it was painted with watercolors. This adds some depth to the infographic without making it too much to look at. I used pictures and shapes to organize the information and make it clear.

The infographic focuses on digital literacy and its importance. It talks about things like being online thinking critically making content staying safe online and using tools well. I did not want to use words to explain these things. I wanted to make it simple for students to understand. The infographic shows how what you do online affects who you're. It tells students to be careful and think about what they do when they're online. The infographic also tells students to make things and talk to people online of just looking at things.

I had a time getting the right amount of information and design. At first the infographic had many words and it looked messy. I made it better by using bullet points and simpler words. This made it look nicer and easier to understand. I learned how to use Canva. I got better at picking the things arranging them and making sure everything looks the same. This taught me that it is important to say things in a way and make things look good when you are making digital content. Digital literacy awareness is important. I hope my infographic helps students understand digital literacy better.

Task 2: Digital Portfolio

For this task I set up my portfolio on GitHub, LinkedIn and Kaggle. Each platform has a role in building my presence. I used GitHub to share my projects and track my coding. I have uploaded my projects and project code sources on GitHub. I will keep adding more as I study computer science, both for classes and personal learning. I also made a profile readme file to introduce myself and what I like. LinkedIn is where I build my network and connect with people in the field. I filled out my profile with my education background and a short bio. Linkedin has helped me connect and network with people globally. Kaggle has been great for exploring data and improving my data analysis skills. I have been using Kaggle since my first semester in classes like Introduction to Problem Solving and Computational Physics. This task helped me see how important it is to have an online presence.

Over the four years I plan to update my GitHub with projects, use LinkedIn to build connections and keep using Kaggle to get better at data analysis and problem solving.
This will help me build a profile that matches my academic and career goals, specifically my GitHub portfolio my LinkedIn network and my Kaggle data analysis skills.

Task 3: Exploring Platforms

For this task I worked on getting better at solving problems by practicing coding questions on HackerRank. I also made some questions to help people learn about literacy.

I used HackerRank to solve Python problems. These problems helped me learn things like getting information from users doing math and making simple decisions. I have used HackerRank before so this task helped me keep practicing. As I solved problems I got badges and certificates. These showed me how I was doing. I think HackerRank is a place to get better at coding and solving problems, I have added some pictures. These pictures show the problems I solved my code and how my code worked.

I also made questions about literacy. These questions are about things like being safe not getting tricked by fake emails and using good passwords. I tried to make them easy to understand.

One hard thing for me was figuring out how to solve problems in a way.. I got better at it over time. I started breaking problems into steps.

Overall this task helped me feel more comfortable, with programming and being aware of digital things. I got better at solving problems. I learned some new things. HackerRank helped me practice. I made some useful questions.

Task 4

When a student is trying to get an internship they really need to be careful with the emails they send. If a student sends an email that does not have all the information or is not clear it can cause a problem. For instance if a student sends a message that says "I want internship please reply" without saying what the email is about who they are and a little bit about themselves it looks bad. The person who is hiring for the internship might not even bother to respond. They might think the student is not really interested in the internship.

The student could have done a better job by writing a nice email that has a clear subject line, a short introduction and a good explanation of why they want the internship. If the student also includes details like what they are studying and what they are good at and if they are polite it will make a much better impression on the person who is hiring for the internship. The internship is what the student is applying for so they should make sure the email, about the internship is good.

TASK 4: Part B

Social Media Do’s and Don’ts

Do’s

- ✓ Think before posting and consider how it may affect your digital image
- ✓ Keep personal information private and secure
- ✓ Use strong and unique passwords for different accounts
- ✓ Verify information before sharing it online
- ✓ Maintain a positive and respectful online presence

Don’ts

- × Don’t share passwords, OTPs, or sensitive personal data
- × Don’t click on suspicious links or unknown attachments
- × Don’t post offensive or inappropriate content
- × Don’t overshare personal details publicly
- × Don’t spread misinformation without checking facts

TASK 5: CASE STUDY ON CYBERCRIME

The Fake Buyer UPI Payment Scam

Cybercrime type: UPI/Online Payment Fraud

What is crime?

Crime is when someone does something and breaks the law. UPI payment fraud is a problem where bad people use tricks to fool people into sending them money. They make the person think they are getting money. Really they are sending their own money to the bad person.

How it typically happens:

1. The scammer finds something for sale on a website like OLX or a college group. They contact the person selling it pretending to be a buyer.
2. The fake buyer says they will pay the price the seller is asking for without trying to negotiate. The seller trusts them.
3. Then they say they need to buy the thing now so the seller thinks they have to hurry.
4. The scammer sends a code or a link saying it will put money in the sellers account but it is a lie.
5. The scammer stays on the phone with the seller telling them what to do. The seller thinks they are getting money so they put in their secret UPI code.
6. Then the sellers money goes to the persons account.

Who is usually targeted in this situation?

The people who usually get tricked are college students people selling things online and people who do not know how UPI payments work.

The consequences:

When someone gets tricked they lose money, which can be very bad for a student who does not have a lot of money. They also feel very upset and stressed.

It is very hard to get the money and it takes a long time and most of the time people do not get their money back UPI payment fraud is a big problem and people need to be careful, with UPI

Payments.

Source:

Realistic scenario modeled on published reports from "Navigating the Mechanics of UPI Payment Fraud" and "Digital Deception: A Case Study of UPI Scams".

Task 5: Cybercrime

Stay Safe Online: Cybercrime Prevention Checklist for College Students

1. UPI PINs are only for sending money: you never need to enter your PIN to receive cash. If a buyer asks you to scan a code and enter your PIN, it's a scam.

2. Watch out for scam: If a stranger randomly sends a small amount to your GPay, claims it was an accident, and pressures you to return a larger amount, don't do it. It's a trap.

3. Don't click random panic links: If you get an urgent SMS saying your electricity bill is due or your bank account is about to be blocked, ignore it.

4. Never download remote-access apps: Scammers will tell you to install apps like "Team connect" to help you fix a banking issue, but it just gives them full control of your phone.

5. Stop and verify: If you get a terrifying call saying you're under "digital arrest" for a package you didn't send, hang up and call official authorities directly.

6. Double-check the receiver's name: A tiny typo in a UPI ID can send your money to a completely random person, and you probably won't be able to undo it.

7. Keep your phone updated: Just install your OS updates and use an antivirus so malware can't easily hide in fake apps.

8. Report it immediately: If you get scammed, freeze your account ASAP. Call the Helpline at 1930 or report it on the National Cyber Crime Portal (cybercrime.gov.in) immediately to improve your chances of getting the money back.

Project Report Reflection

I was working on this task. I found something that really surprised me. These scams are actually really simple. It is easy for someone to fall for them. I always thought that cybercrimes needed computer skills.. Most of the time they just trick people into making little mistakes. For example they might click on a link. Say yes to a payment request without thinking about it.

This made me think that knowing about these scams is more important than knowing a lot about computers. If you know how these scams work you can stop problems from happening.

I am going to change some of my habits when I'm online. I will be more careful before I do anything especially if it has to do with money or personal information about me. I will make sure to check where things come from I will not rush into decisions. I will check links and requests twice before I respond to them. I will be more careful, with cybercrimes and scams because I do not want to fall for them

CONCLUSION

Overall, this project helped me understand digital literacy in a more practical way. Through the different tasks, I was able to actually use tools like GitHub, LinkedIn, and HackerRank instead of just learning about them.

It also made me more aware of how my online presence and communication can affect how others see me. I realized that even small things, like how I write emails or what I share online, matter more than I thought.

This project has helped me build a basic foundation, and I plan to keep improving these skills and use these platforms more actively in the future.
